

# How your business can help stop stormwater pollution

## We can all make a big difference in stopping pollution.

Each year significant pollution is created due to careless work habits and lack of awareness about what pollutes our stormwater system. Under the Resource Management Act it is illegal to allow any substance other than rain water to enter the stormwater system unless a resource consent has been obtained from The Greater Wellington Regional Council. Failure to do so may lead to a \$750 fine or prosecution.

## Pollution of our waterways can:

- make streams and the harbour unsafe for swimming and other recreational activities
- ruin the appearance of our streams and harbour
- kill plants and animals

## Stormwater sumps should only drain rain.

The stormwater system collects water from roofs, footpaths, roads and groundwater. All roadside gutters and sumps lead to the stormwater system. If you tip waste down a roadside sump it will end up in a stream or the harbour. Stormwater is not treated – it will appear in the waterways in much the same condition as when you tipped it down there.

## What pollutes our waterways?

Oil, grease, tar, silt, concrete cutting wastewater, cement wash water, paint, litter, cigarette butts, animal droppings, detergent and chemical cleaners are all pollutants. And remember, just because a product is labelled 'biodegradable' doesn't mean it can be dumped into a stormwater drain.

## What can your business do to stop pollution?

Your business can stop pollution getting into the stormwater system by:

- not hosing waste away, instead sweep it up and dispose of it with your other rubbish
- mopping up spills immediately and not letting them flow into the stormwater drain
- temporarily blocking stormwater entry points to prevent silt and other pollution entering the system while you work, this includes concrete cutting water
- making sure the gutters are clear of debris including leaves and grass clippings
- improving work practices to reduce silt transport
- reducing silt transport by planning earthworks in sections as opposed to excavating all at once
- using a silt settlement tank to prevent silt entering the stormwater system
- putting litter in rubbish bins, including cigarette butts
- picking up all animal droppings
- disposing of excess paint and chemicals in the hazardous waste area at landfills
- washing your car on the grass or in a commercial car wash – this stops detergent, oils and greases getting into the stormwater
- regularly servicing your car and machinery. This stops leaking oil getting into the stormwater system – it only takes one litre of oil to contaminate a thousand tonnes of water.
